Red-sided Garter Snake

Species Description

Identification
Red-sided garter snakes, sometimes referred to as common garter snakes, can grow as long as 49 inches. In Colorado, they are usually considerably smaller and may only grow as long as about 3 feet (36 inches). They have patches of red between their lighter stripes.

Preferred Habitats
Garter snakes hibernate during the winter, up to seven or eight months in the more northern parts of their range. While they are active, they are wetland-dependent, occupying most wetland habitat types within Colorado.

Diet
Red-sided garter snakes consume primarily amphibians, fish, and earthworms.

Conservation Status
The abundance of red-sided garter snakes is mostly unknown. In Colorado, they are listed as a Species of Concern and a Tier 2 Species of Greatest Conservation Need (CPW 2015). Population declines of other garter snakes, such as the western terrestrial garter snake (Thamnophis elegans) that consume mostly amphibians, have apparently been tied to amphibian declines. Because the red-sided garter snake eats primarily amphibians, it is possible populations of red-sided garter snakes are associated with populations of amphibians.

Range
The red-sided garter snake is found in Canada and the western United States, with a disjunct distribution in the western United States. In Colorado, they are found in the northeast and north-central part of the state.

Species Distribution

Red-sided garter snakes (Thamnophis sirtalis parietalis, Family Colubridae) occur in wetlands on Colorado's northeastern plains.
**Preferred Habitat Conditions**

**Management Recommendations**

This fact sheet contains easy-to-use guidelines for understanding habitat needs of Colorado Parks and Wildlife priority wetland-dependent wildlife. A number of practical steps can be taken to improve habitat for red-sided garter snakes.

**Hydrology**
- For breeding ponds, maintain depth of >20 inches until metamorphosis completed.
- After mid-July, draw down water containing predatory fish and bullfrog larvae.

**Vegetation**
- Provide grass buffers around breeding ponds.
- Manage for dense emergent vegetation.

**Contaminations**
- Reduce nitrogen loading.
- Reduce pesticides, chemicals and other toxins.
- Reduce predatory fish.
- Possibly reduce or change mosquito control.

**Land Use / Other**
- Eliminate livestock access to ponds.
- Avoid or minimize clear-cutting.

**Conservation**
- Translocate frogs to re-establish populations that can serve as a food source.
- Promote conservation programs to provide grassland component in the landscape.
- Promote native species in adjacent lands.

Habitat Scorecard for Red-sided Garter Snakes (v. Jan 2016)
Assessment of habitat before and after restoration or management actions

Project Name:_______________________________________________________  Date(s) of Assessment: ___________________

Instructions: Enter one value that best describes early to mid-summer conditions of each habitat variable, using the numbers in the value column. Habitat variables are in shaded boxes; ranges of condition are directly below each variable. If condition is outside range or is not described, enter a zero.
